Module 03 — Object-Oriented Programming (OOP) in Java

Phase: OOP Java
Previous module: Methods
Next module: Collections

Module Outcome:

- Know the three-part map: class → inherit → abstract / interface / polymorphism
- Open Part 1 today — Java OOP is heavier than the Python block
- Point BankAccount and Campus Wallet to the right part

This module is split for slow-pace teaching (Definition/Purpose depth: Motivation → concepts with **Try these** → annotated examples → practice → project). Java OOP is **heavier** than the Python OOP block — use the parts in order:

Part	File	Focus
1	03_OOP_Part1_Classes_Encapsulation.md	Class/`new`/`this`/constructor, instance vs static, encapsulation, BankAccount lab
2	03_OOP_Part2_Inheritance.md	Inheritance → `super()` → override → IS-A (single class inheritance)
3	03_OOP_Part3_Polymorphism_Interfaces.md	Abstract classes, interfaces, polymorphism, packages, mini-project push, interview Q&A

Lab kits: 09_bank_account_oop (Part 1) · 10_employee_inheritance (Part 2) · 11_campus_wallet (Part 3)

Assignment: Parts 1–2 each have a **Mini-Project (Assignment)** tied to those kits. The portfolio Campus Wallet **push** (extra types + interfaces) is in Part 3.

Course order note: Exception Handling is **after** OOP. All OOP demos/labs validate with **`print` + `return`** (no `throw` / `try` / `catch` required in OOP).
