Standard Project Deliverables Bundle

Every mini-project and the capstone use the **same submission checklist**. This turns class exercises into portfolio evidence hiring managers can trust.

Required for grading

#	Artefact	Notes
1	**Public GitHub repo**	No secrets; meaningful commit history
2	**README.md**	Problem, features, stack, setup, how to run, screenshots, demo link
3	`requirements.txt` and/or `package.json`	Pinned enough to install; list Python/Node version in README
4	`.env.example`	All keys documented; **never** commit `.env`
5	**Sample / seed data**	SQL dump, fixtures, or `seed` command / JSON
6	**Screenshots**	Happy path; for UI also **mobile width** (~375px)
7	**Demo video (2–5 min)**	Loom/Drive link in README — show run + one feature
8	`.gitignore`	Includes `venv/`, `.env`, `__pycache__/`, `node_modules/`, `staticfiles/`

Capstone extras: deploy URL (or Lab 07 proof), ER diagram image, Postman collection if API exists.

README template (copy)

```
# Project title

## Problem
One paragraph.

## Features
- ...

## Stack
Python 3 · Django · MySQL · ...

## Setup
1. clone
2. python -m venv venv && source venv/bin/activate
3. pip install -r requirements.txt
4. cp .env.example .env  # fill values
5. python manage.py migrate
```

```
6. python manage.py runserver

## Demo
- Live: https://...
- Video: https://...

## Screenshots
(desktop / mobile)

## Sample credentials
- demo@example.com / (see mentor — not a real production password)
```

Skill-level use

Level	Deliverables expectation
Guided	Repo exists; README partial; needs help to run
Independent	Peer can clone and run from README alone
Interview-ready	Learner narrates architecture in demo video clearly

Security note (submissions)

Never commit a real `.env` or live passwords. If that happens by mistake: remove the file from Git tracking, add it to `.gitignore`, commit the fix, and **rotate** the password (treat it as leaked).
