Ticket: Swiggy Canteen Calculator

Customer: Swiggy canteen counter (CampusCart stall)
Need: Staff still use paper for `price × qty + GST`. Build a CLI calculator.

Teaching-order: Linear `main` only — no `if` / `while` / `for` / extra methods.

Starter

Open `starter/CanteenCalculator.java` — one price, one qty, print GST total.

Broken

`broken/CanteenCalculator.java` has bugs (integer division, GST math, messy print).

Done when

- [ ] Uses `double` price and `int` qty
- [ ] Total = price × qty × (1 + 5% GST), two decimals
- [ ] Prints like `Total: ₹105.00`

Stretch (after Flow Control): reject bad input with `if` / re-ask with `while`.
